by Holly Deyo

While having a nice stash of freeze-dried, dehydrated and canned foods is great fall-back, nothing can replace fresh crisp garden vegetables and fragrant, sweet fruit. Increasingly, it is incumbent on individuals to maintain their own supply of life-sustaining seeds.

Seed vaults are not a new concept and had its roots 40 years ago over growing concerns for maintaining bio-diversity. A decade ago, it became mainstream when the global seed vault in Svalbard, Norway took center stage. It is just one of some 1,400 seeds banks around the world. Bet this puts a crimp in Monsanto's Day! As of 2010, in that location alone, more than 500,000 unique seeds rest waiting to bail out humanity.

So what is the chance that the ordinary human would ever have access? Zip. Zero. Cero. Nada. Zilch. Sero. Nulla. Náid.

This one vault of hundreds is in place to serve the global elite, not us. That Bill and Melinda Gates are instrumental in this project should say everything. So now we circle around to what we, the every day person, can do to ensure that we have the same benefits, sans the New World Order.

*Create your own seed bank.*

It is such a simple deal that it seems really silly to write on this topic. However, if you haven't investigated it, then maybe it's *not* so silly. Maybe it will help *you*.

This is what you need: seeds. Period. Well, OK, and maybe a bit of know-how. This article shows you

how to maintain your own private seed bank that will keep you vegetable (therefore vitamin) self-sufficient. Healthy.

## OLDIES AND GOODIES

Seeds have been preserved in ancient Egyptian tombs and found viable to present day. Remember the mummies? Egyptians completely dried out their ancestors to the point where scientists today can *carefully* examine their bodies. Ditto for Israelis that preserved Judean date palms (the Methuselah tree) going back to Jesus' time. Now look at the oldest plant to have ever have been regenerated from 32,000 year-old seed. OK, don't laugh, these seeds were buried by Siberian squirrels – no relation to Putin – a testament to keeping seeds *really* cold. Surely we are smarter than squirrels! Why should it be any different now? It's not. You just have to know what to do to keep your seeds viable for many years.

This is in direct opposition to what seed companies want you to believe, especially the 6 big opponents to self-sufficiency: Monsanto, Syngenta, DuPont, Bayer, BASF and Dow. So say them that you can't keep seeds for much longer than what the package says, even properly stored. Baloney! Double ditto [for medications](#) that drug companies want you to believe 'die' quickly as was exposed in [Dare To Prepare](#). This is beyond criminal and wasteful. **Americans buy \$350 billion of prescription drugs every year.** Then people needlessly throw a great deal of them away because they believe the pharmaceutical lie.

Shelf lives extend MUCH longer than what they would have you believe. *You just have to know what to do.* I will share the secrets.
