

An Ebola Outbreak Would Be Advantageous For Globalists

0 0 0 0

It's sad to say with such finality, but a universal fact of existence is that most of the people you meet in this life are fundamentally and functionally ignorant. Not necessarily stupid, but certainly ignorant. Ignorance comes not from a lack of intelligence, but from a denial of knowledge and truth. That is to say, ignorance takes hold when people decide to act as though they know and understand a thing, even if they do not. Ignorance prevails when a society or nation chooses to value the appearance of expertise, to value the theater of overconfidence, and to cheer for the bluster of morons rather than admit that they have unanswered questions on subjects they do not yet grasp. For nothing is worse for the self absorbed than to acknowledge that they do not know.

Entire nations have fallen throughout history because of this terrible weakness...

By extension, such ignorance is not just an inherent disease but also an easily exploitable disease. When we refuse to think critically and examine our surroundings thoroughly, we become like grazing gazelles oblivious to the predators encircling us in the tall grass. And, just as there are predatory individuals that hide amongst us, there are also predatory oligarchs that camouflage themselves as benevolent politicians and financial professionals standing above us. Normal predators we fear, establishment predators we invite into our homes as protectors, saviors, and partners.

The disease of ignorance leaves us vulnerable to many other plagues, including literal plagues like the Ebola virus. When we take the establishment at its word concerning the threat of Ebola outbreak, we make ourselves vulnerable. When people assume that the worst could never happen to them, history shows us that it inevitably does.

The recent discovery of an Ebola infected patient in Dallas, Texas has led to reasonable concern from the general population, but mainstream media efforts along with CDC and White House spin have subdued any practical response by the citizenry. The constant droning voice of the establishment claims there is nothing to be worried about; that even if there was an outbreak in the U.S., it would be quickly squashed by highly prepared medical response teams.

First and foremost, the existence of just one Ebola infected person within America's borders indicates a likelihood of others, or the possibility of others in the near future unless policies and procedures are changed. As far as I can tell, the government has no intention of introducing rational fail-safes such as requiring mandatory quarantine for those seeking to reenter the U.S. from known outbreak regions, shutting down unrestricted travel into the country from countries with Ebola, training hospitals properly in the identification of the disease, or committing mass resources to quelling Ebola in hot zones before it reaches our shores, at least not in time to make a difference.

Secondly, the establishment also has no intention of giving the general public accurate information as to the behavior and dangers of Ebola. Those I have spoken with in the medical field including some who work within major city hospitals have related to me that the CDC has not been honest in its assessment of the probability of outbreak. For example, the CDC is consistently reminding the public that Ebola is not an "airborne" disease, and this is technically true as far as the science indicates. However, they forget to mention that it is indeed a "droplet born" disease, meaning, it can travel through the air carried in an infected cough or sneeze. The tight quarters of an airplane make for a perfect petri dish, with droplets and

particulates passing back and forth through the same space and oxygen for hours at a time. The spread of Ebola is nowhere near as containable as the CDC claims.

I have been told that most hospitals are completely unprepared to fend off an outbreak of a virus as destructive as Ebola. Little to no standardized training has taken place, and some facilities are only now putting together a list of emergency procedures. Human error within the chain of care also occurs often, as we saw in Dallas, Texas, and these errors can lead to greater infection in a hospital environment.

CDC and WHO efforts in countries like Liberia have been so ineffective and halfhearted it leads one to question why their budgets are in the billions of dollars? Where is all their capital and their resources going if not to bring an unprecedented hammer down on a clearly dangerous outbreak of Ebola? Why is the virus being allowed to flourish rather than being destroyed right where it started? Where has the full force of the CDC been for the past several months while death gestates in Africa?

The one legitimate function of government, any government, is to protect the right of the people to pursue their own life, liberty, and happiness. I think stopping the invasion of mortal viruses would fall into this category. The one job our government is MANDATED to do, and it refuses to do it. Why?

I have made the point many times in the past and I'll make it here again; when a catastrophe takes place, or a crisis is imminent, ask yourself, who ultimately benefits? I believe that the lack of strong prevention response from our government, an inadequacy which is obvious to all of the health care workers I have talked with and to anyone who has the sense to do their own research, could be absolutely deliberate. I believe the spread of Ebola may be desired by certain power brokers, and here is why:

The Perfect Cover Event

I have been warning for quite some time that the banking establishment in particular is well aware that an economic collapse of incredible proportions is coming. In fact, they have done everything in their power to make one possible. This collapse, according to my research, is designed to clear the way through monetary carpet bombing for a new international Bretton Woods-style agreement which will plant the foundation of a truly global economic system centralized and controlled by a highly select few elites. Needless to say, the internationalists would prefer not to take the blame for such a calamity.

Regional or widespread war, terrorism, cyber attacks, etc, are all useful vehicles to conjure mass confusion, and can also be used as scapegoats for the eventual downfall of our economy. That said, a viral pandemic truly surpasses them all in effectiveness. All other tragedies could easily be tied to the first "domino" or "linchpin" (as Rand Corporation calls it) of Ebola transmission, but the strategy goes deeper than this...

An Act Of Nature

Even though most people are well aware of the fact that governments have been engineering biological weapons for decades, few people think political leadership would ever use them at all, let alone use them on the people they are tasked to protect. Even with the complacency and inaction of our government in terms of the response to Ebola, the general assumption by most of the American population will be that any viral outbreak is a product of nature, not of men.

Acts of nature are not things that the common man can easily rebel against. People rebel against governments and corrupt despots all the time, but not the plague. If a viral pandemic strikes, nearly everything a government does after the fact, no matter how corrupt or destructive, can be rationalized as necessary for the greater good of the greater number. If anyone does rebel, they will be labeled as pure evil, for they are now disrupting the government's ability to stop the pandemic from spreading, and thus, are partly responsible for the mass deaths that follow.

During a viral outbreak, government becomes mother, father, nurse and protector. No matter how abusive they are, most people will still look to them for safety and guidance, primarily because they have no knowledge of disease. What they do not understand, they will fear, and fear always drives the ignorant into the arms of tyrants. One should also take into consideration the fact that most globalists lean towards

the ideology of eugenics and promote the concept of population reduction. A pandemic would fulfill this desire nicely...

Rationalized Economic Collapse

Who would question the event of an economic collapse in the wake of an Ebola soaked nightmare? Who would want to buy or sell? Who would want to come in contact with strangers to generate a transaction? Who would even leave their house? Ebola treatment in first world nations has advantages of finance and a cleaner overall health environment, but what if economic downturn happens simultaneously? America could experience third world status very quickly, and with it, all the unsanitary conditions that result in an exponential Ebola death rate.

The treasury, labor department, and private Federal Reserve have gone to vast lengths to skew statistics and rig markets with trillions in fiat dollars. Despite historic numbers of Americans falling off unemployment rolls, imploding shipping and manufacturing statistics, and the U.S. teetering on the edge of global “de-dollarization”, a large portion of the citizenry has been led to believe that economic recovery is assured. What they do not understand is that fiscal implosion is unavoidable, and the whole bull market is a circus designed to distract.

Amidst even a moderate or controlled viral scenario, stocks and bonds will undoubtedly crash, a crash that was going to happen anyway. The international banks who created the mess get off blameless, while Ebola, an act of nature, becomes the ultimate scapegoat for every disaster that follows.

Rationalized Travel Restrictions

If you want to lock down the movement of a population to prevent the spread of dissenting groups or ideas, I can't think of a better way than to claim it is to prevent the spread of a deadly virus. Our government and world health officials are approaching Ebola with an attitude of nonchalance right now, because prevention is NOT part of the plan. When Ebola strikes hard within our country, that is when they will finally decide that strict measures are needed. Suddenly, those borders that they could never secure before will become impassable for you and I. And traveling between states or perhaps even counties may be extraordinarily difficult. “Papers please...” will become the new mantra of petty authority.

Forced Health Measures

Do not be surprised if an Ebola vaccine of some kind suddenly appears on the market just as the situation begins to turn tragic. And, do not be surprised if said vaccine is a total sham that ends up making more people sick. Expect that forced vaccinations will take place, especially as a prerequisite for receiving treatment from CDC or FEMA hazmat facilities. Expect that these facilities will become nothing more than obscure prisons for the sick where people quietly die. Expect that every American will be required to be tested and screened, with biometric data carefully stored, beginning with airport travel (once the virus is already entrenched). The options are endless for abuse in terms of totalitarian health laws when the public thinks they could end up bleeding from every orifice and dying of liver failure.

Rationalized Martial Law

Imagine if some Americans decide they don't like being poked, prodded, tagged and bagged by the establishment. Imagine they decide to fight back, Ebola be damned. An already uphill battle becomes an epic struggle when a large percentage of the population thinks you are a monster that wants to hasten the spread of Ebola. Not that the ignorant count for much in the grand scheme of history, but waking at least some of them up in the future to the bigger threat (the globalists) is hard to do when all they can see is devilish microbes. Those who plan to combat the rise of the internationalists, as I plan to, should accept now the likelihood that the only people we will have on our side tomorrow are the people we have been able to wake up today. Martial law will be welcomed by the rest.

International Response

An international response is almost guaranteed during a major pandemic. Sovereignty will be tossed in the

dirt. UN and WHO teams and perhaps even troops could accompany an aid package to the U.S. Think of the glorious propaganda, as globalists tell stories of how they “saved humanity” by surpassing the barbaric practices of national and individual sovereignty, defeated the Ebola virus (after millions of deaths, of course), and out of the ashes, the “phoenix” of global governance was born. If they succeed, imagine what the history books will say for the next several centuries.

What Do We Do?

There are no silver bullet solutions. There never have been and there never will be. People looking for them will be sorely disappointed and ill prepared after wasting so much time searching for an easy out. The only answer is for communities of people to take their own survival into their own hands and become as self sufficient as possible. This means that neighborhoods, towns, and counties will have to take precautions now to steel themselves for a pandemic event, instead of simply sitting on their hands and expecting government officials to save them.

The treatments for Ebola in most cases involve nothing more than the steady replacement of vital fluids, electrolytes and plasma until the patient’s body can build up an immunity to the virus. Those with stronger immune systems before contraction are more likely to survive and beat back the disease. Government care, for the most part, is NOT going to save many people either way. That is to say, your survival will depend on you and your immune system, not them. Communities that make efforts to prevent contact and that strengthen individual immunity will have a better chance of survival than going into any government run hazmat facility. Government is not needed, and will often end up being more of a threat than the virus itself. Groups I work closely with and talk with, many with their own doctors and nurses, are already setting prevention guidelines in motion.

If you can prove you don’t need the system to save you, their rationale for attempting to control you is weakened. The ignorant will still try to demonize us for our efforts, but self sufficiency is all we have in the face of this kind of storm. If we can lead by example with our own successful health standards while saving people where the establishment could not, perhaps we can turn the tide.
